

Federating Data Centers within ORFEUS: The EIDA experience and future plans

The **EIDA** community

Presented by Angelo Strollo*

Prague

June 29. 2014

Outline

- **ORFEUS evolution:**
 - centralized archive => EIDA => EIDA-NG
- **The EIDA Next Generation**
 - **Routing service**
- **Quick demo using the routing service + fdsws**
- **Output and Input to the routing service**
- **How to maintain/feed federated routing services?**
- **Proposed actions within the FDSN based on the EIDA experience in federating DCs**

ORFEUS

From the ORFEUS Data Center (single DC) to EIDA (distributed DC)

- 1986/87: ORFEUS plan launched/realized
- 2012/13: ORFEUS-VEBSN => ORFEUS-EIDA (EIDA = VEBSN + data holdings from 9 European DCs)
- 2015: ORFEUS-EIDA (10 nodes)

1987 - 30

2013 - 613

2015 ~2000 (5000+)

Year - Number of open and operational stations

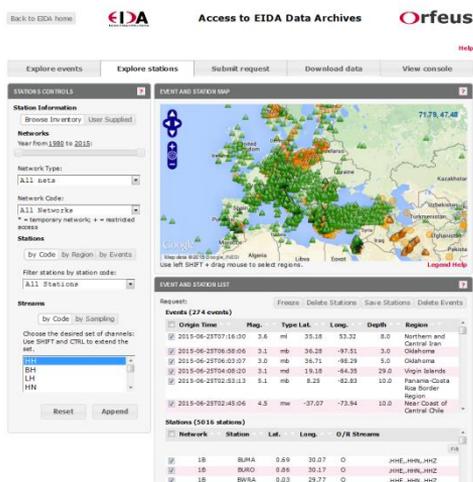

ORFEUS data infrastructure, services and products

EIDA => EIDA-Next Generation

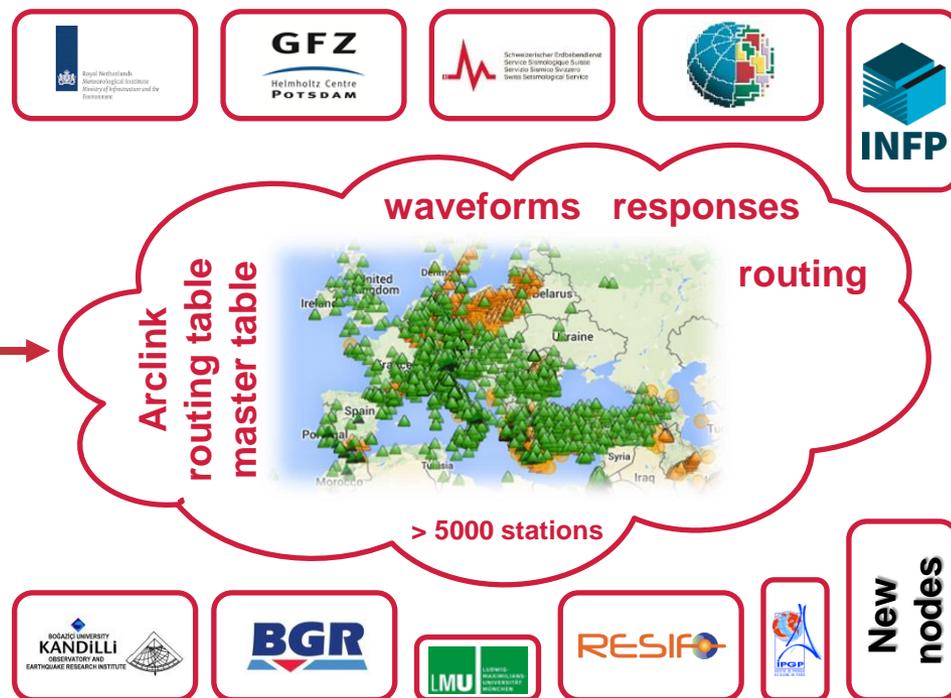

More than just data and federated archive

- Coordination of data holdings and software/strategic developments
- Provides quality control of data/metadata
- Helps define seismological center 'best practice' for ORFEUS community

<http://www.orfeus-eu.org/eida/eida.html>

Users:
Geoscientists
Etc...

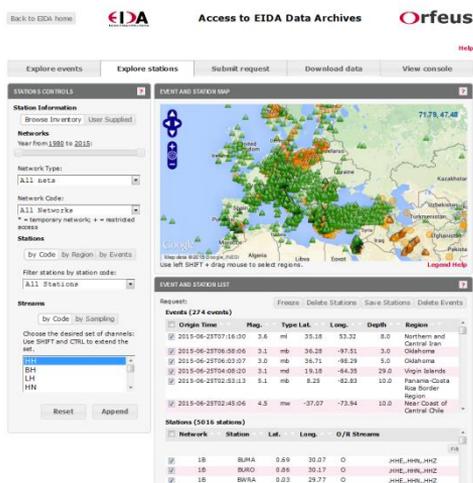

ORFEUS data infrastructure, services and products

EIDA => EIDA-Next Generation

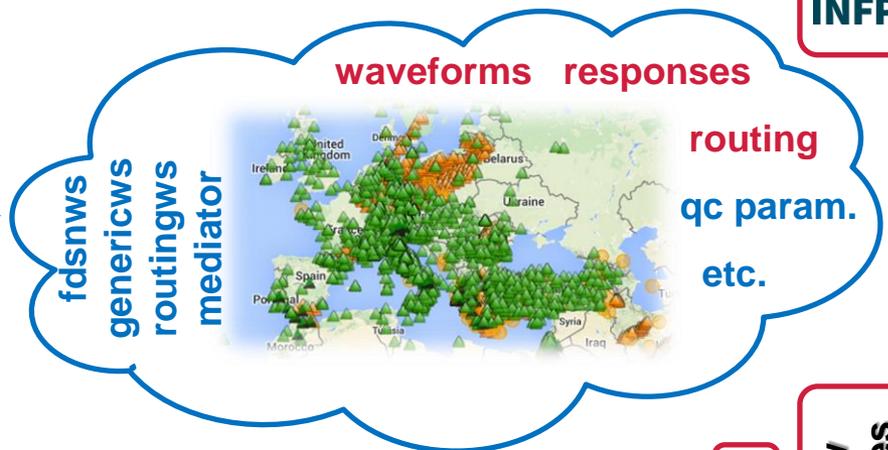

More than just data and federated archive

- Coordination of data holdings and software/strategic developments
- Provides quality control of data/metadata
- Helps define seismological center 'best practice' for ORFEUS community

EIDA Next Generation

A federation of data and services

Service status:
 In production/beta
 Under development
 Design phase

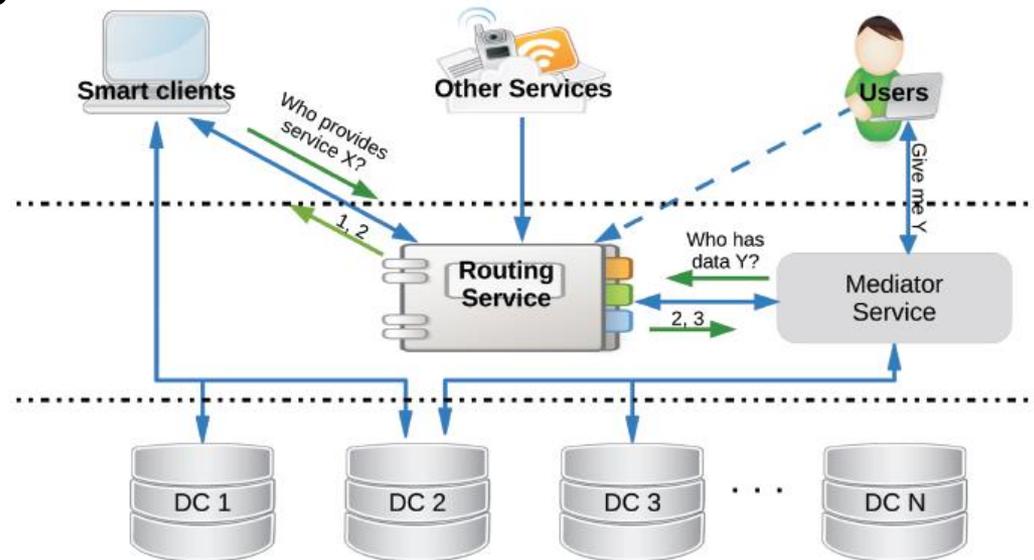

The EIDA routing service

What does a routing service?

- Provides routing to data (streams)
- Routing to services
- Routing priorities

Additional parameters information being discussed:

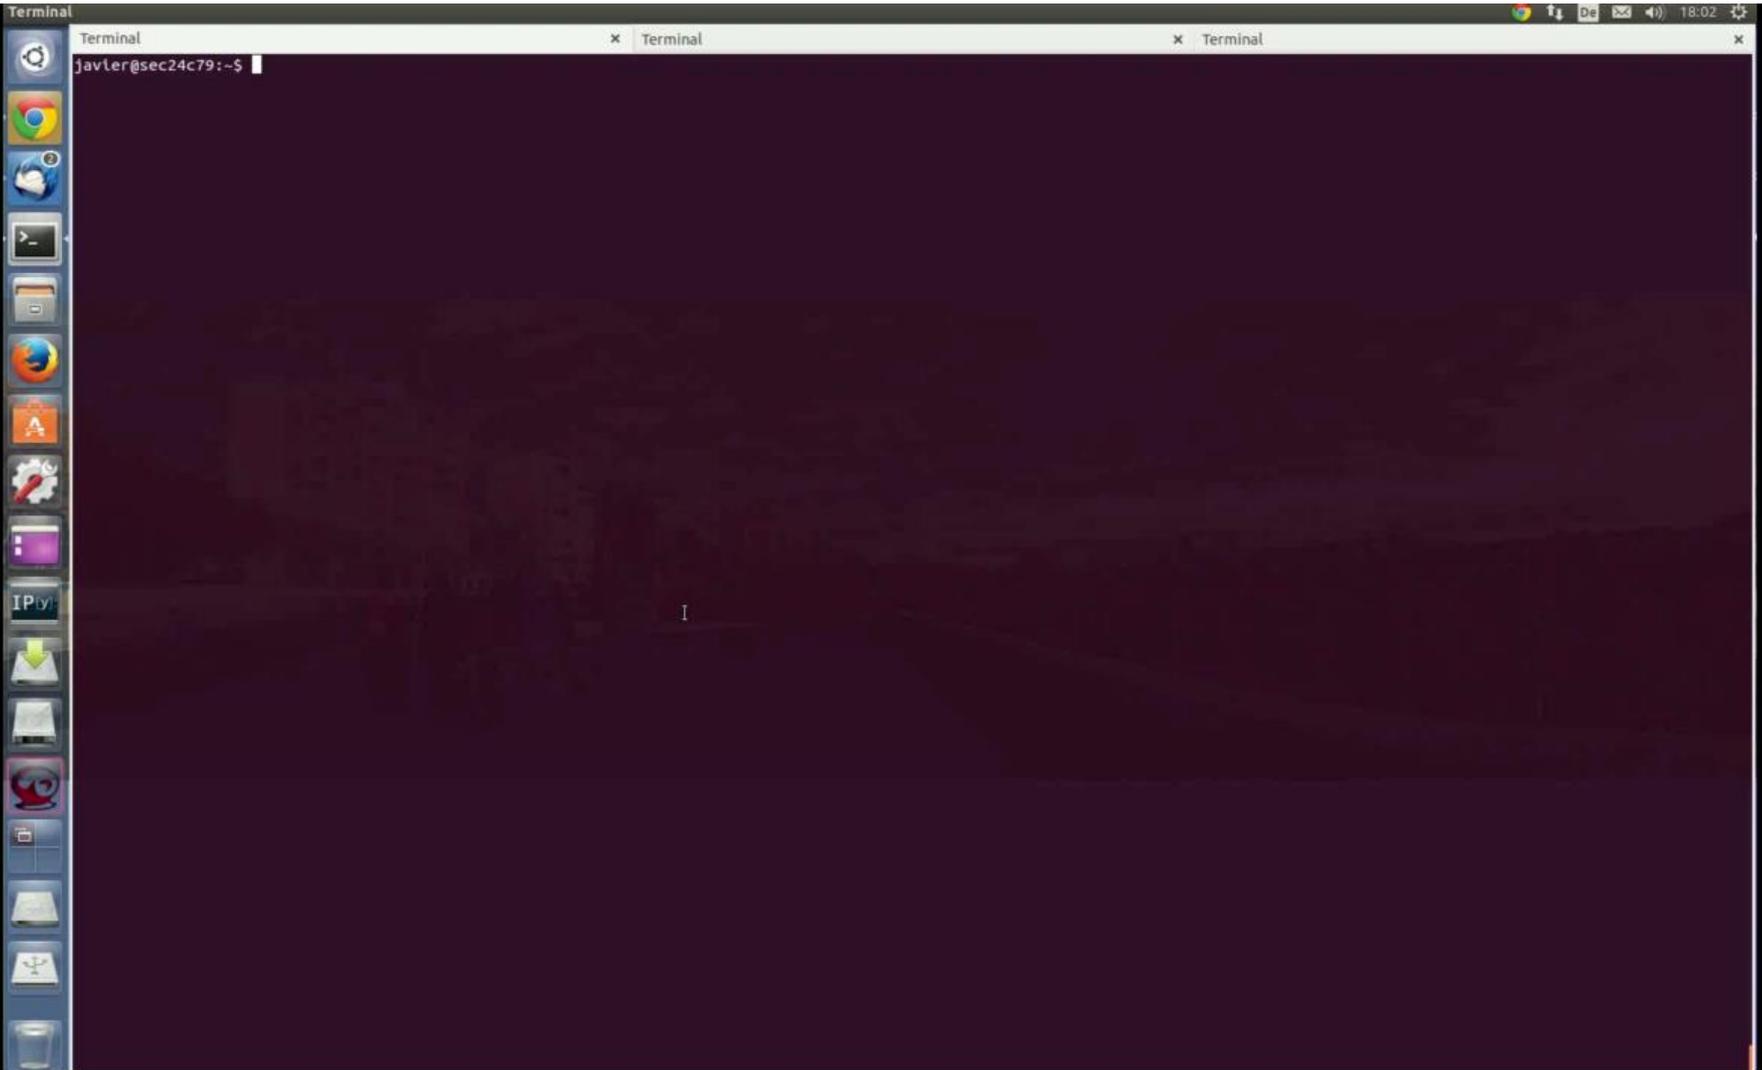

- Geolocation of data and services
- Type of archive (master, validated/non validated copy, etc)
- Contact information

Can also be deployed as a standalone router to run on the client side to create virtual DCs

First stable release 10.2014

SeisComP3 demo Arclink => EIDA routing + fdsnws

The EIDA routing service output

Provides the routing to data and service according to priority level requested by the user.

- Formats: XML, JSON, GET, POST
- Collapsed (useful in case of simple routes , the majority)

The image displays three browser windows side-by-side, each showing the output of a routing query from the EIDA service. The first window shows the XML output, the second shows the JSON output, and the third shows the collapsed HTML output.

XML Output:

```

<?xml version="1.0" encoding="UTF-8" ?>
<service>
  <datacenter>
    <url>
      http://geofon.gfz-potsdam.de/fdsnws/dataselect/1/query
    </url>
    <params>
      <loc>*/</loc>
      <end>
      <sta>*/</sta>
      <cha>*/</cha>
      <priority>1</priority>
      <start>1993-01-01T00:00:00</start>
      <net>GE</net>
    </params>
    <name>dataselect</name>
  </datacenter>
</service>
  
```

JSON Output:

```

[[{"url": "http://geofon.gfz-potsdam.de/fdsnws/dataselect/1/query", "params": [{"loc": "*", "end": "", "sta": "*", "cha": "*", "priority": 1, "start": "1993-01-01T00:00:00", "net": "GE"}], "name": "dataselect"}]]
  
```

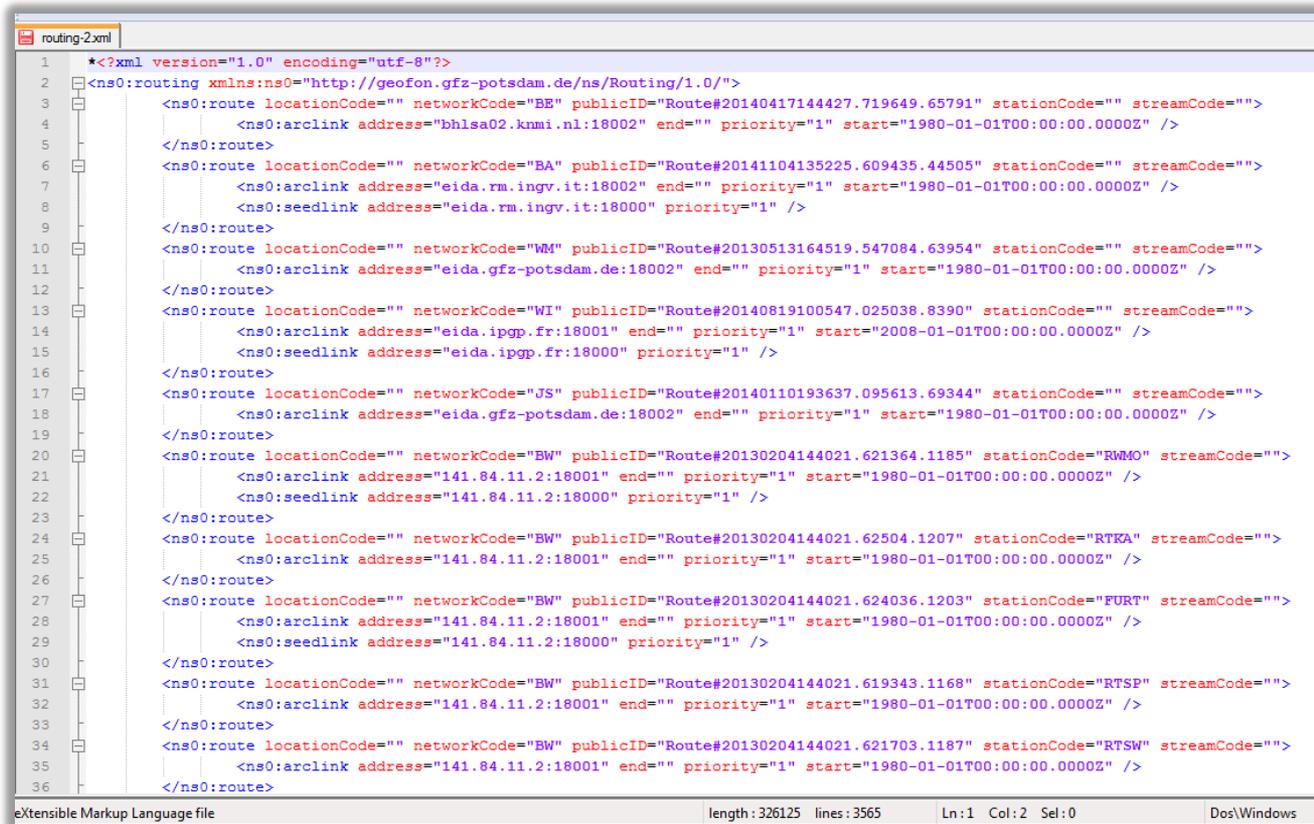

Collapsed HTML Output:

```

http://geofon.gfz-potsdam.de/fdsnws/dataselect/1/query
GE * * 1993-01-01T00:00:00
  
```

Input to the EIDA routing service 1

For the initial deployment at EIDA nodes the Arclink routing table has been used as configuration file.

```

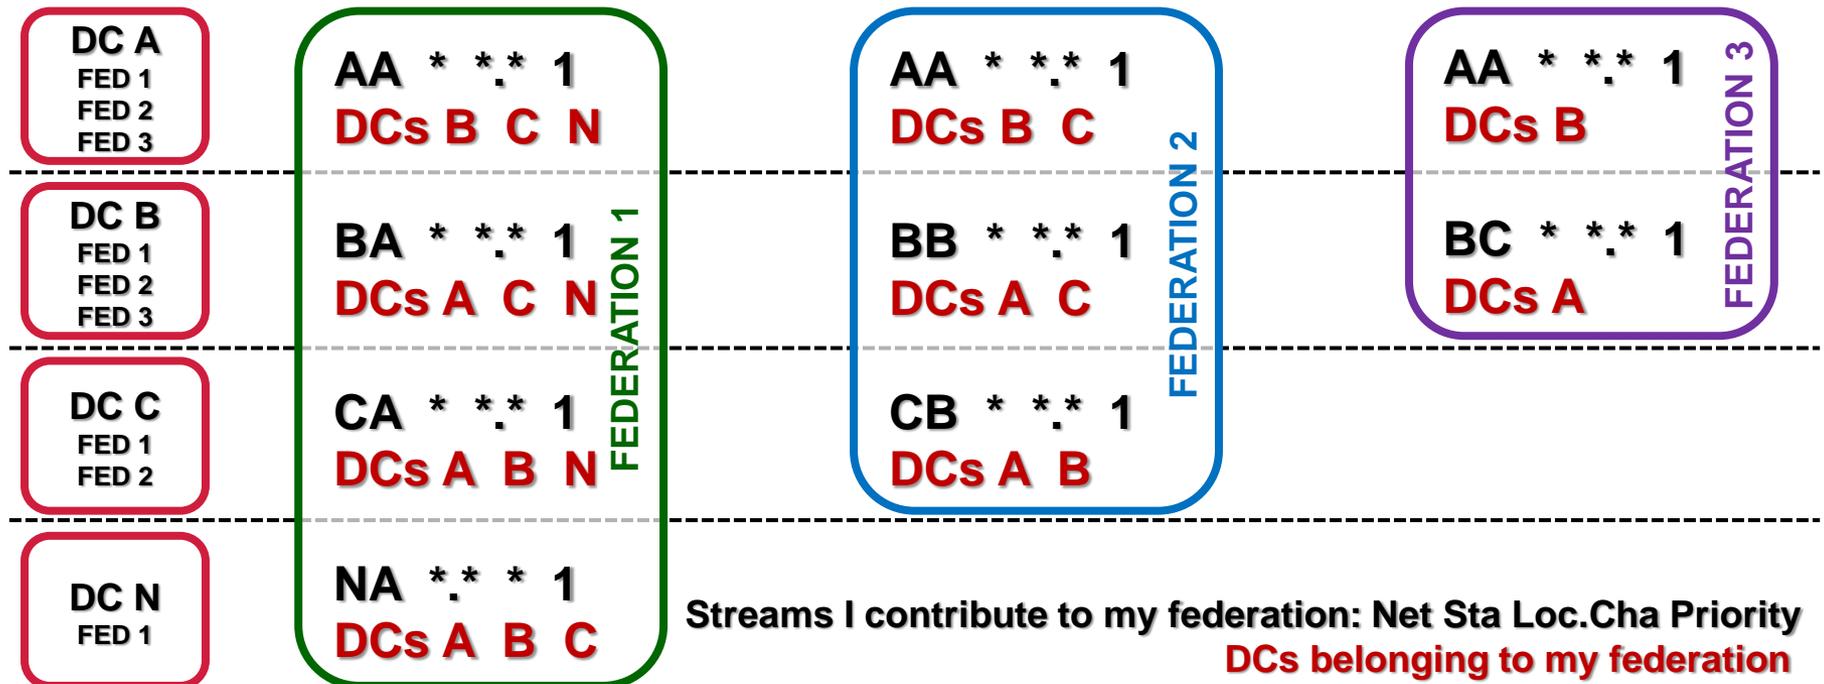

1  *?xml version="1.0" encoding="utf-8"?>

Input to the EIDA routing service 2

The DC to join a federation should declare what He want to expose (data and services) and who are the other DCs belonging to the federation and with what level of priority. This can be done at different levels: Personal /Institutional, European, Global, ...

Some important issues we considered

Simple harvesting of fdsnws-station services will lead to the following ambiguities:

- Questionable priorities in the routes (the decision stays with the data owner or network operator)
- May assume that fdsnws-datasetct and/or other services are running also where fdsnws-station is running
- May wrongly assume additional services
- May need to interpret mismatching station locations

A declarative approach would remove all these ambiguities.

Disadvantage? Not trivial to maintain as an harvested catalog but definitely providing the correct information to the user.

Proposed approach for the FDSN

A federator should be a service/functionality that allows a DC to join a federation of DCs rather than a service harvesting metadata and aggregating them to a single central db.

Information about data/services locations should be gathered from the federator rather than contacting the fdsnws-station directly.

EIDA would welcome a small task force within WGIII to discuss these issues further together with additional services similarly to the approach taken for the DOIs. In particular the following points:

- **Definition of standard output of a federator/routing service**
- **How to input and maintain the routing information**
- **All technical and political implications**
